REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance:

The Prior Art of Record do not anticipate nor do they reasonably suggest the compliant workholder as claimed in claims 1, 5, and 9. The closest prior art, Reynolds (US 2,612,914) teaches a safety device for woodworking machines comprising many of the claimed elements except for that Reynolds lacks the means for urging and a resilient contact element. The contact element (e.g. 22) is resilient to the extent that this element is spring biased by the springs (38). However, this interpretation results in Reynolds lacking a "means for urging" as claimed. On the other hand, the springs may be construed as the "means for urging", but that results in the contact element not being resilient since it is made of steel. It may be argued that any material exhibits a certain degree of "resiliency". But in the context of the claims at bar, a steel or sturdy contact element is outside the bounds of the claims. Furthermore, although at first glance it may appear that another workholder is obvious, the teaching or suggestion would only stem Applicant's prior patent. Thus, it is believed that the claimed invention with the lacking features in combination with the other recited elements are allowable over the prior art of record.

It is noted that with respect to the potential issue of indefiniteness with respect to the separate means for extending and retracting (e.g. claim 1), the Examiner relies on Applicant's prior arguments in the parent application wherein it was the Applicant's position that the double acting piston and equivalents thereof as disclosed in the specification is the separate means.
